Solar + storage: a basis for collaboration

Introducing AVESTA battery engineering and stationary energy storage capabilities

AVESTA AT A GLANCE

Founded in 2019 as AVESTA Battery and Energy Engineering; rebranded as AVESTA Holding in 2024.

Battery engineering, BMS, system integration and recycling capabilities across the battery lifecycle.

WHAT WE CAN BRING TO A PROJECT

Define the system

System sizing, technology selection and economic modeling.

Integrate the storage

LFP batteries with battery management, power conversion and energy management systems.

Support delivery

Grid-connection planning, deployment strategy and lifecycle support.

Source: AVESTA Battery System Pitch Deck, pp. 2-3, 8. Discussion brief prepared for SOLARSECTOR.

Belgian references across three project scales

Solar PV paired with battery energy storage for industrial applications

PROJECT	SOLAR PV	BATTERY	LOCATION	REPORTED STATUS
Ninove	660 kW	1 MWh	Belgium	Operational
Zeebrugge	8 MW	50 MWh	Belgium	Operational
BE Volt	2 MW	30 MWh	Belgium	Under construction

NINOVE: A RELEVANT C&I STARTING POINT

660 kW solar + 1 MWh BESS at AVESTA facilities, with smart peak-shaving software described in the source.

51 MWh operational

+ 30 MWh under construction

Calculated from the reported project statuses; not all 81 MWh is operational.

Source: AVESTA Battery System Pitch Deck, pp. 9-10. Status and capacities are as reported in the source.

Turn the introduction into a pilot opportunity

Proposed collaboration topics for discussion - scope and responsibilities to be agreed

01

Solar self-consumption

Store daytime PV generation for use when the site needs it.

02

Peak-demand management

Control site demand where the tariff and load profile support savings.

03

Power continuity

Assess storage for critical loads, including the required islanding and protection design.

AGREE A FIRST SITE

SOLARSECTOR: discuss target customers, project pipeline and delivery capabilities.

AVESTA: develop a battery concept, sizing and integration approach for the selected site.

Together: review load data, PV, tariff and backup needs; agree owners and a feasibility review.

Use cases informed by source pp. 3, 9-10. Collaboration steps are proposals, not existing agreements.
